Fall 2022

Why Graphics?

Can you determine the shape of the data?

```
print(round(demo1[,1:2], 4), n = 24)
```

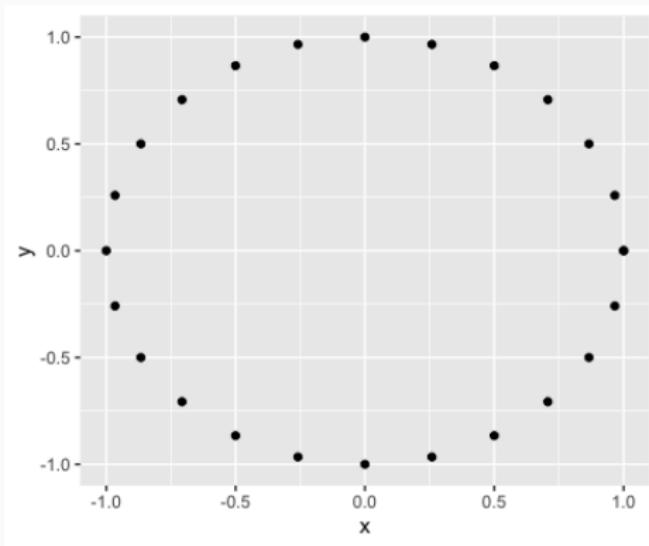

```
# A tibble: 25 x 2
  x     y
  <dbl> <dbl>
1 1     0
2 0.966 0.259
3 0.866 0.5

15 -0.343  -1.13 
16  0.37   -0.740
17 -0.305  -0.913
18  0.184  -1.12 
19  0.342  -1.15 
20 -0.0158 -0.781
# ... with 2,351 more rows
# i Use `print(n = ...)` to see more rows
```

Why Graphics?

Data gets messy

- Visuals help us understand and communicate the data

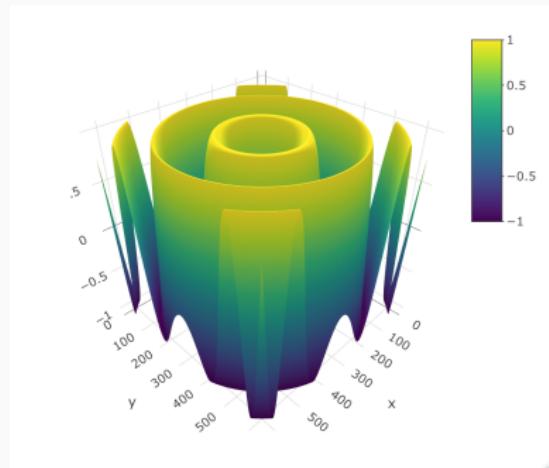

```
demo3plotA <- ggplot(demo3) +  
  geom_contour_filled(aes(x = Var1, y = Var2, z = Var3))  
demo3plotA
```

Why Graphics?

Sophisticated graphics software helps:

```
adjusted_demo3 <- pivot_wider(demo3, names_from = "Var1",
                                values_from = "Var3")
demo3plotB <- plot_ly(z = as.matrix(adjusted_demo3[,-1])) %>%
    add_surface()
demo3plotB
```

dplyr Data Manipulation

To create effective graphics, we need to learn data manipulation.

Select R packages in tidyverse:

- dplyr
- tidyr
- purrr
- stringr
- readr
- ggplot2

dplyr Data Manipulation

Data transformation with dplyr :: CHEAT SHEET

dplyr functions work with pipes and expect **tidy data**. In tidy data:

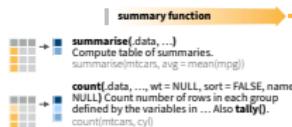

Each observation, or case, is in its own row

`x %>% f(y)` becomes `f(x, y)`

Summarise Cases

Apply **summary functions** to columns to create a new table of summary statistics. Summary functions take vectors as input and return one value (see back).

Group Cases

Use `group_by(data, ..., add = FALSE, drop = TRUE)` to create a "grouped" copy of a table grouped by columns in ... dplyr functions will manipulate each "group" separately and combine the results.

Use `rowwise_(data, ...)` to group data into individual rows. dplyr functions will compute results for each row. Also apply functions to list-columns. See tidyR cheat sheet for list-column workflow.

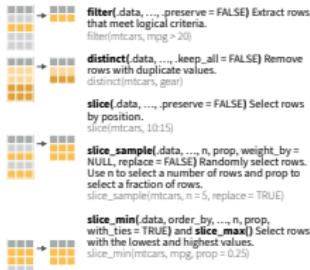

`ungroup(x, ...)` Returns ungrouped copy of table.
`ungroup(g_mtcars)`

Manipulate Cases

EXTRACT CASES

Row functions return a subset of rows as a new table.

Logical and boolean operators to use with filter()

<code>==</code>	<code><</code>	<code><=</code>	<code>is.na()</code>	<code>%in%</code>	<code> </code>	<code>xor()</code>
<code>=</code>	<code>></code>	<code>>=</code>	<code>is.na()</code>	<code>!</code>	<code>&</code>	

See ?base::Logic and ?Comparison for help.

ARRANGE CASES

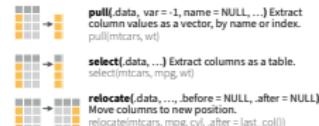

ADD CASES

Manipulate Variables

EXTRACT VARIABLES

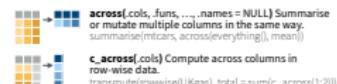

Column functions return a set of columns as a new vector or table.

Use these helpers with `select()` and `across()`

e.g. <code>select(mtcars, mpg, cyl)</code>	
<code>contains_(match)</code>	<code>num_range(prefix, range)</code>
<code>ends_with_(match)</code>	<code>all_of_(any_of(x, ..., vars))</code>
<code>starts_with_(match)</code>	<code>everything()</code>

MANIPULATE MULTIPLE VARIABLES AT ONCE

MAKE NEW VARIABLES

Apply **vectorized functions** to columns. Vectorized functions take vectors as input and return vectors of the same length as output (see back).

dplyr Data Manipulation

Vectorized Functions

TO USE WITH MUTATE ()

```
mutate([!], dtransmute) #apply vectorized functions to columns to create new columns. Vectorized functions take vectors as input and return vectors of the same length as output.
```

vectorized function

OFFSET

```
dplyr::lag() - offset elements by 1  
dplyr::lead() - offset elements by -1
```

CUMULATIVE AGGREGATE

```
dplyr::cumall() - cumulative all()  
dplyr::cumany() - cumulative any()  
dplyr::cummax() - cumulative max()  
dplyr::cummean() - cumulative mean()  
dplyr::cummin() - cumulative min()  
dplyr::cumprod() - cumulative prod()  
dplyr::cumsum() - cumulative sum()
```

RANKING

```
dplyr::cume_dist() - proportion of all values <=  
dplyr::dense_rank() - rank w ties = min, no gaps  
dplyr::min_rank() - rank with ties = min  
dplyr::ntile() - bins into n bins  
dplyr::percent_rank() - min_rank scaled to [0,1]  
dplyr::rank_number() - rank with ties = "first"
```

MATH

```
+, *, /, ^, %%, %% - arithmetic ops  
log(), log2(), log10() - logs  
<, >, <=, >=, != - logical comparisons  
between x & y (left & right)  
dplyr::near() - safe == for floating point numbers
```

MISCELLANEOUS

```
dplyr::case_when() - multi-case if_else()
```

```
  starts_with("%")  
  matches(type = case_when/  
    height > 200 ~ "large",  
    species == "Droid"  
    ~ "robot",  
    TRUE)
```

```
dplyr::coalesce() - first non-NaN value by  
element #cross a set of vectors  
if_else() - element-wise if/else()  
dplyr::na_if() - replace specific values with NA  
pmax() - element-wise max()  
pmin() - element-wise min()
```

Summary Functions

TO USE WITH summarise ()

```
summarise() applies summary functions to columns to create a new table. Summary functions take vectors as input and return single values as output.
```

summary function

COUNT

```
dplyr::n() - number of values/rows  
dplyr::n_distinct() - # of unique  
sum(is.na()) - # of non-NAs
```

PPOSITION

```
mean() - mean, also mean(is.na())  
median() - median
```

LOGICAL

```
mean() - proportion of TRUE's  
sum() - # of TRUE's
```

ORDER

```
first() - first value  
last() - last value  
nth() - value in nth location of vector
```

RANK

```
quantile() - nth quantile!!  
min() - minimum value  
max() - maximum value
```

SPREAD

```
IQR() - Inter-Quartile Range  
mad() - median absolute deviation  
sd() - standard deviation  
var() - variance
```

Row Names

Tidy data does not use rownames, which store a variable outside of the columns. To work with the rownames, first move them to a column.

```
tbl_df::rownames_to_column()
```

```
Move row names into col.  
a <- rownames_to_column(mtcars, by = "C")
```

```
tbl_df::column_to_rownames()
```

```
Move col into row names.B  
column_to_rownames(a, by = "C")
```

```
Also tbl_df::has_rownames() and
```

```
tbl_df::remove_rownames().
```

Combine Tables

COMBINE VARIABLES

`bind_col(..., name_repair)` Returns tables placed side by side as a single table. Columns lengths must be equal. Columns will NOT be matched by id (to do that look at Relational Data below), so be sure to check that both tables are ordered the way you want before binding.

RELATIONAL DATA

Use a "Mutating Join" to join one table to columns from another, matching values with the rows that they correspond to. Each join retains a different combination of values from the tables.

`left_join(x, y, by = NULL, copy = FALSE,`
`na.rm = c("x", "y") ...)`, keep = FALSE,
na_matches = "na") Join matching values from x to y.

`right_join(x, y, by = NULL, copy = FALSE,`
`na.rm = c("x", "y") ...)`, keep = FALSE,
na_matches = "na") Join matching values from y to x.

`inner_join(x, y, by = NULL, copy = FALSE,`
`na.rm = c("x", "y") ...)`, keep = FALSE,
na_matches = "na") Join data. Retain only rows with matches.

`full_join(x, y, by = NULL, copy = FALSE,`
`na.rm = c("x", "y") ...)`, keep = FALSE,
na_matches = "na") Join data. Retain all values, or variances.

COLUMN MATCHING FOR JOINS

`tbl_df::use_by(c("col1", "col2", ...))` to
specify one or more common
columns to match on.
`left_join(x, y, by = "A")`

`tbl_df::use_named_vector(x, by = c("col1" =
"col2"))`, to match on columns that
have different names in each table.
`left_join(x, y, by = c("C" = "D"))`

`tbl_df::use_sufix(x, by = c("C" = "D",
"suffix"))` to give to unmatched columns that
have the same name in both tables.
`left_join(x, y, by = c("C" = "D",
"suffix = c("1", "2")))`

COMBINE CASES

`bind_rows(..., id = NULL)` Returns tables one on top of the other as a single table. Set .id to a column name to add a column of the original table names (as pictured).

Use a "Filtering Join" to filter one table against the rows of another.

`semi_join(x, y, by = NULL, copy = FALSE,`
`na.rm = c("x", "y") ...)` Return rows of x
that have a match in y. Use to see what
will be included in a join.

`anti_join(x, y, by = NULL, copy = FALSE,`
`na.rm = c("x", "y") ...)` Return rows of x
that do not have a match in y. Use to see
what will not be included in a join.

Use a "Nest Join" to inner join one table to
another into a nested data frame.

`nest_join(x, y, by = NULL, copy =
FALSE, keep = FALSE, name =
NULL, ...)` Join data, nesting
matches from y in a single new
data frame column.

SET OPERATIONS

`tbl_df::intersect(x, y, ...)`
Rows that appear in both x and y.

`tbl_df::setdiff(x, y, ...)`
Rows that appear in x but not y.

`tbl_df::union(x, y, ...)`
Rows that appear in x or y.
(Duplicates removed).
`tbl_df::union_all()`
retains duplicates.

Use `setequal()` to test whether two data sets
contain the exact same rows (in any order).

tidyverse Data Manipulation

Data tidying with tidyverse :: CHEAT SHEET

Tidy data is a way to organize tabular data in a consistent data structure across packages.

A table is tidy if:

Each variable is in its own column

&

Each observation, or case, is in its own row

Access variables as vectors

Preserve cases in vectorized operations

Tibbles

AN ENHANCED DATA FRAME

Tibbles are a table format provided by the `tibble` package. They inherit the data frame class, but have improved behaviors:

- Subset a new tibble with `[]`, a vector with `[]`.
- No partial matching when subsetting columns.
- Display concise views of the data on one screen.

`options(tibble.print_max = n, tibble.print_min = m, tibble.width = Inf)` Control default display settings.

`View()` or `glimpse()` View the entire data set.

CONSTRUCT A TIBBLE

`tibble(...)` Construct by columns.
`tibble(x = c("a", "b", "c"))`

`tibble(...)` Construct by rows.

`tibble(~c("a",
"1", "2",
"3", "4",
"5", "6",
"7", "8",
"9", "10"))`

Both make this tibble
A tibble: 3 × 2
 #> #> `x` <dbl>
 #> #> `y` <dbl>
 #> #> 1 1 1
 #> #> 2 2 2
 #> #> 3 3 3

`as_tibble(x, ...)` Convert a data frame to a tibble.

`enframe(x, name = "name", value = "value")`
Convert a named vector to a tibble. Also `dframe()`.

`is_tibble(x)` Test whether x is a tibble.

Reshape Data

Pivot data to reorganize values into a new layout.

table4		
country	year	cases
A	1999	0.7K
B	1999	37K
C	1999	212K
A	2000	2K
B	2000	80K
C	2000	213K

table5		
country	year	cases
A	1999	0.7K
B	1999	37K
C	1999	212K
A	2000	2K
B	2000	80K
C	2000	213K

`pivot_longer(data, cols, names_to = "name", values_to = "value", values_drop_na = FALSE)`
"Lengthen" data by collapsing several columns into two. Column names move to a new `names_to` column and values to a new `values_to` column.

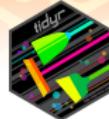

`pivot_longer(table4, cols = 2:3, names_to = "year", values_to = "cases")`

table2		
country	year	cases
A	1999	0.7K
B	1999	37K
C	1999	212K
A	2000	2K
B	2000	80K
C	2000	213K

table3		
country	year	rate
A	1999	0.7K/2M
B	1999	37K/2M
C	1999	212K/2M
A	2000	2K/2M
B	2000	80K/2M
C	2000	213K/2M

`pivot_wider(data, names_from = "name", values_from = "value")`
The inverse of `pivot_longer()`. "Widen" data by expanding two columns into several. One column provides the new column names, the other the values.

`pivot_wider(table2, names_from = type, values_from = count)`

Expand Tables

Create new combinations of variables or identify implicit missing values (combinations of variables not present in the data).

table6		
country	year	cases
A	1999	0.7K
B	1999	37K
C	1999	212K
A	2000	2K
B	2000	80K
C	2000	213K

`expand(data, ...)` Create a new tibble with all possible combinations of the values of the variables listed in ...
Drop other variables.
`expand(mtcars, cyl, gear, carb)`

table7		
country	year	cases
A	1999	0.7K
B	1999	37K
C	1999	212K
A	2000	2K
B	2000	80K
C	2000	213K

`complete(data, ..., fill = list())` Add missing possible combinations of values of variables listed in ... Fill remaining variables with NA.
`complete(mtcars, cyl, gear, carb)`

Handle Missing Values

Drop or replace explicit missing values (NA).

table8		
country	year	cases
A	1999	0.7K
B	1999	37K
C	1999	212K
A	2000	2K
B	2000	80K
C	2000	213K

`drop_na(data, ...)` Drop rows containing NA's in ... columns.
`drop_na(x, x2)`

table9		
country	year	rate
A	1999	0.7K/2M
B	1999	37K/2M
C	1999	212K/2M
A	2000	2K/2M
B	2000	80K/2M
C	2000	213K/2M

`fill(data, ..., direction = "down")` Fill in NA's in ... columns using the next or previous value.
`fill(x, x2)`

table10		
country	year	rate
A	1999	0.7K/2M
B	1999	37K/2M
C	1999	212K/2M
A	2000	2K/2M
B	2000	80K/2M
C	2000	213K/2M

`replace_na(data, replace)`
Specify a value to replace NA in selected columns.
`replace_na(x, list(x2 = 2))`

tidyverse Data Manipulation

Nested Data

A **nested data frame** stores individual tables as a list-column of data frames within a larger organizing data frame. List-columns can also be lists of vectors or lists of varying data types.

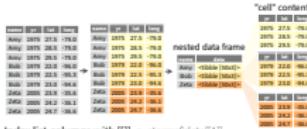

Use a nested data frame to:

- Preserve relationships between observations and subsets of data. Preserve the type of the variables being nested (factors and datetimes aren't coerced to character).
- Manipulate many sub-tables at once with **purr** functions like `map()`, `map2()`, or `map_if()` with `dplyr rowwise()` grouping.

CREATE NESTED DATA

`nest(data, ...)` Moves groups of cells into a list-column of a data frame. Use alone or with `dplyr::group_by()`:

1. Group the data frame with `group_by()` and use `nest()` to move the groups into a list-column.
`n_storms <- storms %>%
group_by(name) %>%
nest()`
2. Use `nest(new_col = c(x,y))` to specify the columns to group using `dplyr::select()` syntax.
`n_storms <- storms %>%
nest(data = c(year,long))`

Index list-columns with `[[[]]`. `n_storms$data[[1]]`

CREATE TIBBLES WITH LIST-COLUMNS

`tibble::tribble(...)` Makes list-columns when needed.

`tribble(~max, ~seq,`
3, 1:3;
4, 1:4;
5, 1:5)

RESHAPE NESTED DATA

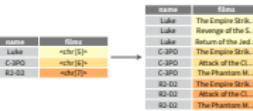

`unnest(data, cols, ..., keep_empty = FALSE)` Flatten nested columns back to regular columns. The inverse of `nest()`.

`n_storms %>% unnest(data)`

`unnest_longer(data, col, values, to = NULL, indices_to = NULL)`

Turn each element of a list-column into a row.

```
starwars %>%  
select(name, films) %>%  
unnest_longer(films)
```

`unnest_wider(data, col)` Turn each element of a list-column into a regular column.

```
starwars %>%  
select(name, films) %>%  
unnest_wider(films)
```

TRANSFORM NESTED DATA

A vectorized function takes a vector, transforms each element in parallel, and returns a vector of the same length. By themselves vectorized functions cannot work with lists, such as list columns.

`dplyr::rowwise(data, ...)` Group data so that each row is one group, and within the groups, elements of list-columns appear directly (accessed with `[[]]`, not as lists of length one. When you use `rowwise()`, dplyr functions will seem to apply functions to list-columns in a vectorized fashion.

Apply a function to a list-column and **create a new list-column**.

```
n_storms %>%  
rowwise() %>%  
mutate(n = list(dim(data)))
```

`dim()` returns two
rowwise() %>%
mutate(n = list(dim(data)))

wrap with `list` to tell mutate to create a list-column

Apply a function to a list-column and **create a regular column**.

```
n_storms %>%  
rowwise() %>%  
mutate(n = nrow(data))
```

`rowwise() %>%
integer per row`

Collapse **multiple list-columns** into a single list-column.

```
starwars %>%  
rowwise() %>%  
mutate(transport = list(append(vehicles, starships)))
```

`append()` returns a list for each row, so col type must be list

Apply a function to **multiple list-columns**.

```
starwars %>%  
rowwise() %>%  
mutate(_n_transports = length(c(vehicles, starships)))
```

`length()` returns one integer per row

See **purr** package for more list functions.

OUTPUT LIST-COLUMNS FROM OTHER FUNCTIONS

`dplyr::mutate()`, `transmute()`, and `summarise()` will output list-columns if they return a list.

`mutate(%>%`
`group_by(cyl) %>%`
`summarise(c = list(quantile(mpg)))`

ggplot2 Data Visualization

Stats

An alternative way to build a layer.

A stat builds new variables to plot (e.g., count, prop).
A geom is built by changing the default stat of a geom function, or by creating a new one using a stat function, `stat_count` for "bar", which calls a default geom to make a layer (equivalent to a geom function). Use `...name...` syntax to map stat variables to aesthetics.

geom to use | stat | stat_name | geom_name
+ stat_density_2d | aes(x=||, y=level),
geom = "polygon" | variable created by stat

```
c + stat_bin(binwidth=1, boundary=10)  
x,y | count ..count.., density ..density..  
c + stat_count(width=1) x,y | count ..prop..  
c + stat_density(adjust=1, kernel="gaussian")  
x,y | count ..density.., scaled ..scaled..  
c + stat_bin(binwidth=10, drop=TRUE)  
x,y, fill | count ..density..  
c + stat_bin(binwidth=10) x,y, fill | count ..density..  
c + stat_density_dodge(dodge=TRUE, n=100)  
x,y, color | size ..size.., level ..level..  
c + stat_dodge(position="sqrt", segments=.05, type="l")  
x + stat_contour(level=1) x,y, x_order | level..  
x + stat_hex(hexagon=bins=20, bins=30, fun=max)  
x,y, z, fill | value ..value..  
l + stat_summary(fun=2)(dodge=x), bins=30, fun=max|  
x,y,z, fill | value ..value..  
f + stat_bumpiness(1.5)  
x,y | lower ..middle.., upper ..width.., ymin ..ymin.., ymax ..ymax..

Scales

Override defaults with scales package.

n <- d + geom_bar(aes(fill = f))
r <- d + geom_bar(aes(fill = f))
+ scale_fill_manual(values = c("skyblue", "royalblue", "blue", "navy"))
+ scale_y_continuous(limits = c(0, 10), break = 10, labels = c("0", "10"))
range of values to include in transformation
+ scale_y_log10() | scale_y_sqrt() | scale_y_reverse()
+ scale_y_sqrt() | scale_y_log10() | scale_y_reverse()
+ scale_y_log10() | scale_y_sqrt() | scale_y_reverse()

GENERAL PURPOSE SCALES

Used for x or y aesthetics (as shown here)

scale_x_continuous() - Map continuous values to visual ones.
scale_x_discrete() - Map discrete values to visual ones.
scale_x_binned() - Map continuous values to discrete bins.
scale_x_identity() - Use data values as visual ones.
scale_x_manual(values = c()) - Map discrete values to mutually chosen visual ones.
scale_x_date(format = "mmm dd", labels = c("Jan", "Feb", "Mar", "Apr", "May", "Jun", "Jul", "Aug", "Sep", "Oct", "Nov", "Dec")) - Treat data values as dates.
scale_x_datetime() - Treat data values as date times.
Same as scale_x_date(). See strftime for label formats.

X & Y LOCATION SCALES

Used with x or y aesthetics (as shown here)

scale_x_log10() - Plot x on log10 scale.
scale_x_reverse() - Reverse the direction of the x axis.
scale_x_sqrt() - Plot x on square root scale.

COLOR AND FILL SCALES (DISCRETE)

n + scale_fill_brewer(palette = "Blues")
For palette choices:
RColorBrewer::display.brewer.all()
n + scale_fill_grey(start = 0.2,
end = 0.8, na.value = "red")

COLOR AND FILL SCALES (CONTINUOUS)

o <- c(gm, geom_dodge(aes(fill = x)))
o + scale_fill_distiller(palette = "Blues")
o + scale_fill_gradient(low = "red", high = "yellow")
o + scale_fill_gradient2(low = "red", high = "blue",
mid = "white", midpoint = 25)

o + scale_fill_gradientn(colors = topo.colors(6))
Also: rainbow(), heat.colors(), terrain.colors(),
cm.colors(), RColorBrewer::brewer.pal()

SHAPE AND SIZE SCALING

p <- geom_point(aes(shape = f1, size = cy))
p + scale_shape(shape, scale_size)
p + scale_shape_manual(values = c(3:7))
p + scale_color_manual(values = c("black", "darkblue", "blue", "lightblue", "yellow", "orange", "red", "darkred", "black"))
p + scale_radius(range = c(1, 6))
p + scale_size_area(max_size = 6)

Customize aspects of the theme such as axis, legend, panel, and facet properties.

+ ggplot() + theme(plot.title.position = "top")

+ theme(panel.background = element_rect(fill = "blue"))

Coordinate Systems

r <- d + geom_bar()
r + coord_cartesian(xlim = c(0, 10), ylim = c(0, 10))
The default cartesian coordinate system.

r + coord_fixed(ratio = 1/2)
ratio, xlim, ylim - Cartesian coordinates with fixed aspect ratio.
ggplot(mpg, aes(x = year) + geom_bar())
flip cartesian coordinates by switching x and y aesthetic mappings.

r + coord_polar(theta = "x", direction = 1)
theta, start, direction - Polar coordinates.

r + coord_trans(x = "sqrt", y = "sin")
Transformed cartesian coordinates. Set strains and strains to the name of a warping function.

n + coord_quickmap()
n + coord_map(project = "elliptic", orientation = "north", scale = 1, clip = "off")
Map projections from the mapproj package (mercator (default), azequalarea, lagrange, etc.).

Position Adjustments

Position adjustments determine how to arrange geoms that would otherwise occupy the same space.

a <- ggplot(mpg, aes(vt)) + r + dvlt

s + geom_bar(position = "dodge")
Stacks elements side-by-side.
s + geom_bar(position = "fill")
Stack elements on top of one another, normalize height.

e + geom_point(position = " jitter")
Add random noise to X and Y position of each element to avoid overlapping.
e + geom_label(position = "nudge")
Nudges labels away from points.

b + geom_bar(position = "stack")
Stack elements on top of one another.

Each position adjustment can be recast as a function with manual width and height arguments:

s + geom_bar(position = position_jitter(width = 1))

Set theme to adjust facet labels:

t + facet_grid(cols = vars(f1), labeller = label_both)
t: facets | cols: f1 | labeller: label_both

t + facet_grid(rows = vars(f1), labeller = label_bquote(alpha ~ f1))
t: facets | rows: f1 | labeller: label_bquote(alpha ~ f1)

Faceting

Facets divide a plot into subplots based on the values of one or more discrete variables.

t + ggplot(mpg, aes(cty, hwy)) + geom_point()

t + facet_grid(cols = vars(f1))
Facet into columns based on f1.

t + facet_grid(rows = vars(year))
Facet into rows based on year.

t + facet_grid(rows = vars(year), cols = vars(f1))
Facet into both rows and columns.

t + facet_wrap(~mt)
Wrap facets into a rectangular layout.

Set scales to let axis limits vary across facets.

t + facet_grid(drv = vars(drv), cols = vars(f1), scales = "free")

x and y axes can be mapped to individual facets:
"free_x" - x axis limits adjust
"free_y" - y axis limits adjust

Set labeller to adjust facet label:

t + facet_grid(cols = vars(f1), labeller = label_both)
t: facets | f1: f1 | labeller: label_both

t + facet_grid(rows = vars(f1), labeller = label_bquote(alpha ~ f1))
t: facets | f1: f1 | labeller: label_bquote(alpha ~ f1)

Labels and Legends

Use `label` to label the elements of your plot.

t + label_x = "New x axis label", y = "New y axis label",
title = "Add a title above the plot.",
subtitles = "Add subtitles below the plot.",
caption = "Add a caption below plot.",
alt = "Add alt text to the plot.",
new_x = "New x-axis label title"

t + annotate(gem = "text", x = 8, y = 9, label = "K")
Places annotations in the plot area.

g + guides(dodge = TRUE) | guides(dodge = "left")
g + guides(dodge = "right") | guides(dodge = "center")
g + guides(dodge = "none") | guides(dodge = "none")

g + theme(panel.position = "bottom")
Places legend below the plot area.

n + scale_fill_discrete("Title", labels = c("A", "B", "C", "D", "E"))
Set legend title and labels with a scale function.

Zooming

Without clipping (preferred):

t + coord_cartesian(xlim = c(0, 100), ylim = c(0, 10))

With clipping (removes unseen data points):

t + xlim(0, 100) + ylim(0, 20)

t + scale_x_continuous(limits = c(0, 100)) +
scale_y_continuous(limits = c(0, 100))
